19 HAULAGE AND OFF-ROAD EQUIPMENT

CASE STUDY

The management of Lift-Hi Equipment has decided to conduct a round of safety review seminars focusing on loading techniques. All company employees must undergo extensive training in crane and power shovel operation and safety when they start work at Lift-Hi, but there have been a couple of incidents in recent months. In one case, a rail car was not loaded evenly and in another case, excess rocks fell out of a dipper. Since many of Lift-Hi's jobs have involved working along roads and highways, management might expand the sessions to include roadway procedures.

- 1. You have been selected to lead the seminars. What safe loading practices can you tell employees about?
- 2. What do they need to know about roadway safety?
